## SUBSTITUTED OXAZOLES FOR THE TREATMENT OF INFLAMMATION

### FIELD OF THE INVENTION

5 This invention is in the field of anti-inflammatory pharmaceutical agents and specifically relates to compounds, compositions and methods for treating inflammation and inflammation-associated disorders, such as arthritis.

### BACKGROUND OF THE INVENTION

10 Prostaglandins play a major role in the inflammation process and the inhibition of prostaglandin production, especially production of  $\text{PGG}_2$ ,  $\text{PGH}_2$  and  $\text{PGE}_2$ , has been a common target of antiinflammatory drug discovery. However, common non-steroidal antiinflammatory drugs (NSAIDs) that are active in reducing the prostaglandin-induced pain and swelling associated with the inflammation process are also active in affecting other prostaglandin-regulated processes not associated with the inflammation process. Thus, use of high doses of most common NSAIDs can produce severe side effects, including life threatening ulcers, that limit their therapeutic potential. An alternative to NSAIDs is the use of corticosteroids, which have even more drastic side effects, especially when long term therapy is involved.

25 Previous NSAIDs have been found to prevent the production of prostaglandins by inhibiting enzymes in the human arachidonic acid/prostaglandin pathway, including the enzyme cyclooxygenase (COX). The recent discovery of an inducible enzyme associated with inflammation (named "cyclooxygenase-2 (COX-2)" or "prostaglandin G/H synthase II") provides a viable target of inhibition which more effectively reduces inflammation and produces fewer and less drastic side effects.

35 The references below that disclose antiinflammatory activity, show continuing efforts to find a safe and effective antiinflammatory agent. The novel oxazoles

disclosed herein are such safe and also effective antiinflammatory agents furthering such efforts. The invention compounds are found to show usefulness in vivo as antiinflammatory agents with minimal side effects. The substituted oxazoles disclosed herein preferably selectively inhibit cyclooxygenase-2 over cyclooxygenase-1.

diastereoisomeric salts by treatment with an optically active acid or base. Examples of appropriate acids are tartaric, diacetyltartaric, dibenzoyltartaric, ditoluoyltartaric and camphorsulfonic acid and then separation of the mixture of diastereoisomers by crystallization followed by liberation of the optically active bases from these salts. A different process for separation of optical isomers involves the use of a chiral chromatography column optimally chosen to maximize the separation of the enantiomers. Still another available method involves synthesis of covalent diastereoisomeric molecules by reacting an amine functionality of precursors to compounds of Formula I with an optically pure acid in an activated form or an optically pure isocyanate. Alternatively, diastereomeric derivatives can be prepared by reacting a carboxyl functionality of precursors to compounds of Formula I with an optically pure amine base. The synthesized diastereoisomers can be separated by conventional means such as chromatography, distillation, crystallization or sublimation, and then hydrolyzed to deliver the enantiomerically pure compound. The optically sodium and zinc or organic salts made from N,N'-dibenzylethylenediamine, choline, chloroprocaine, diethanolamine, ethylenediamine, meglumine (N-methylglucamine) and procaine. All of these salts may be prepared by conventional means from the corresponding compound of Formula I by reacting, for example, the appropriate acid or base with the compound of Formula I.

Also included in the family of compounds of Formula I are the stereoisomers thereof. Compounds of the present invention can possess one or more asymmetric carbon atoms and are thus capable of existing in the form of optical isomers as well as in the form of racemic or nonracemic mixtures thereof. Accordingly, some of the compounds of this invention may be present in racemic mixtures which are also included in this invention. The optical isomers can

be obtained by resolution of the racemic mixtures according to conventional processes, for example by formation of active compounds of Formula I-III can likewise be obtained by utilizing optically active starting materials. These  
 5 isomers may be in the form of a free acid, a free base, an ester or a salt.

Additional methods for resolving optical isomers, known to those skilled in the art may be used, for example, those discussed by J. Jaques et al in Enantiomers,  
 10 Racemates, and Resolutions, John Wiley and Sons, New York (1981).

### GENERAL SYNTHETIC PROCEDURES

The compounds of the invention can be synthesized according to the following procedures of Schemes I-XI, wherein the R-R<sup>8</sup> substituents are as defined for Formula I-III, above, except where further noted.

### Scheme I

20

Synthetic Scheme I shows the four step procedure which can be used to prepare the substituted ketone

compounds **4** from the substituted benzaldehyde **1** and acid **2**, where  $R^2$  is alkyl. In step one, benzaldehyde **1** and substituted acetic acid **2** are first heated in acetic anhydride and triethylamine via a Perkin condensation.

5 In step two, hydrolysis produces the corresponding 2,3-disubstituted acrylic acids **3**. In step three, the acrylic acids **3** are reacted with diphenylphosphorylazide (DPPA) and triethylamine in toluene at  $0^\circ\text{C}$  and then warmed to room temperature to form acylazides. In step  
10 four, the crude acylazides are heated to form an isocyanate via a Curtius rearrangement. The isocyanate is trapped as the *N*-*t*-butyloxycarbonyl enamine derivative via the addition of *tert*-butanol. Acidic hydrolysis, such as by using concentrated HCl, provides  
15 the substituted ketone **4** intermediates.

## Scheme II

20

Synthetic Scheme II shows an alternative approach which can be used to prepare substituted ketone intermediates **7**, isomers of **4** where  $R^2$  is alkyl, via the use of Friedel-Crafts acylation. An acylating agent **5**,  
25 such as an acid chloride, is treated with aluminum chloride in an inert solvent, such as methylene chloride, chloroform, nitrobenzene, dichlorobenzene or chlorobenzene, and reacted with alkylthiobenzene **6** to form ketone **7**.

30 Other synthetic approaches are possible to form the desired ketones. These alternatives include reacting appropriate Grignard or lithium reagents with substituted acetic acids or corresponding esters.

## Scheme III

5

Scheme III shows the five step synthesis, as described in U.S. Patent No. 3,647,858, which can be used to prepare the 5-(4-alkylsulfonylphenyl)oxazoles **12** of Formula I from ketone **4** (prepared in Scheme I).

- 10 Preparation of the silyl enol ether **8** (where  $TBSCl$  is *tert*-butyl-dimethylsilyl chloride) is followed by oxidation, such as with *m*-chloroperoxybenzoic acid ( $MCPBA$ ), to give the appropriate silylated benzoin **9**. Desilylation of this silylated benzoin **9** is achieved
- 15 using aqueous acid, such as trifluoroacetic acid, to give the desired benzoin **10**. Reaction of the benzoin **10** with the appropriate acid chloride in the presence of base, such as pyridine, gives the benzoin esters **11**

which may be converted to the antiinflammatory oxazoles **12** of the present invention upon treatment with ammonium acetate in acetic acid at reflux.

5

### Scheme IV

Scheme IV shows the five step synthesis, similar to that described above in Scheme III, which can be used to prepare the 4-(4-alkylsulfonylphenyl) oxazoles **17** of Formula I from ketone **7** (prepared in Scheme II). Preparation of the silyl enol ether **13** is followed by oxidation, such as with *m*-chloroperbenzoic acid, to give the appropriate silylated benzoin **14**. Desilylation of this silylated benzoin **14** is achieved using aqueous acid, such as trifluoroacetic acid to give the desired benzoin **15**. Reaction of the benzoin **15** with the appropriate acid

chloride in the presence of base, such as pyridine, gives the benzoin esters **16** which may be converted to the antiinflammatory oxazoles **17** of the present invention upon treatment with ammonium acetate in acetic acid at reflux.

5

### Scheme V

10 Scheme V shows the four step synthesis which can be  
 used to prepare oxazoles **20** from ketones **4** (prepared in  
 Synthetic Scheme I). In step one, ketones **4** are readily  
 brominated via the addition of bromine in acetic acid to  
 form the 2-bromoethanone intermediates. In step two,  
 15 reaction of the bromoethanone with aqueous acetone yields  
 the benzoin **18**. In step three, reaction of the benzoin **18**  
 with the appropriate acid chloride in the presence of base,  
 such as pyridine, gives the benzoin esters **19**. In step  
 four, benzoin esters **19** are converted to the oxazoles **20**  
 20 upon treatment with ammonium acetate in acetic acid at  
 reflux.

## Scheme VI

- 5 Similarly, Scheme VI shows the four step synthesis which can be used to prepare oxazoles **23** from ketones **7** (prepared in Synthetic Scheme II). In step one, ketones **7** are readily brominated via the addition of bromine in acetic acid to form the 2-bromoethanone intermediates. In
- 10 step two, reaction of the bromoethanone with aqueous acetone yields the benzoin **21**. In step three, reaction of the benzoin **21** with the appropriate acid chloride in the presence of base, such as pyridine, gives the benzoin esters **22**. In step four, benzoin esters **22** are converted
- 15 to the oxazoles **23** upon treatment with ammonium acetate in acetic acid at reflux.

## Scheme VII

An alternative synthesis of the  
 5 alkylsulfonylphenyloxazoles **12** and **17** is accomplished as  
 shown in Synthetic Scheme VII from oxazoles **20** and **23**  
 (prepared in Schemes V and VI). Oxazoles **20** and **23**, where  
 $\text{R}^2$  is an alkyl radical, are oxidized, such as with MCPBA (2  
 equivalents) in methylene chloride to form the  
 10 antiinflammatory alkylsulfonyl oxazoles **12** and **17**. Other  
 suitable oxidizing agents include Oxone®, hydrogen  
 peroxide, periodate, peracetic acid and the like.

## Scheme VIII

- 5 In a method similar to that shown in Scheme IV, Scheme VIII shows a method for preparing oxazoles **28** where Ar<sup>1</sup> represents an aromatic or heteroaryl radical without a sulfur substituent. A solution of aldehyde **24** and zinc iodide in an organic solvent such as dichloromethane (100
- 10 mL) is treated with trimethylsilylcyanide to give the trimethylsilyl cyanohydrin. The trimethylsilyl cyanohydrin is added to a solution of Ar<sup>1</sup>-magnesium bromide in diethyl ether while maintaining the temperature between 25-35 °C to give the benzoin **25**. The benzoin **25**, pyridine, and acid
- 15 chloride are reacted at room temperature to yield the benzoin ester **26**. Addition of ammonium acetate to the benzoin ester **26** yields the oxazole **28**. Alternatively, the hydroxy-oxazoline **27** is isolated. Dehydration of the hydroxy-oxazoline **27** yields the oxazoles **28**. By reversing
- 20 the positions of R<sup>1</sup> and Ar<sup>1</sup> in the keto-enol **25**, oxazoles can be prepared with R<sup>1</sup> is at position 4.

## Scheme IX

5 Synthetic Scheme VIII shows the three step procedure  
 used to prepare sulfonamide antiinflammatory agents **30**  
 from their corresponding methyl sulfones **29**. In step one,  
 a THF solution of the methyl sulfones **29** at about  $-78^\circ\text{C}$  is  
 treated with an alkyl lithium reagent, e.g., methyllithium,  
 10 n-butyllithium, etc. In step two, the anions generated in  
 step one are treated with an organoborane, e.g.,  
 triethylborane, tributylborane, etc., at about  $-78^\circ\text{C}$  then  
 allowed to warm to ambient temperature prior to stirring at  
 reflux. In step three, an aqueous solution of sodium  
 15 acetate and hydroxyamine-O-sulfonic acid is added to  
 provide the corresponding sulfonamide antiinflammatory  
 agents **30** of this invention.

## Scheme X

20

Scheme X shows another method of preparing  
 oxazolybenzenesulfonamides **33** of the present invention.  
 The oxazole **31** is stirred with chlorosulfonic acid at

about 5 °C to give the sulfonyl chlorides **32**. The sulfonyl chloride **32** is reacted at about 5 °C with ammonium hydroxide to give the sulfonamides **33** of the current invention. In addition, disulfonamides can be formed by substitution on R<sup>1</sup> where R<sup>1</sup> is aryl or heteroaryl.

### Scheme XI

10

39

Synthetic Scheme XI shows the five step procedure which can be used to prepare the substituted oxazolo-benzenesulfonamide compounds **39**, from the substituted ketone **34**. The benzenesulfonamide **36** is formed, such as by adding the ketone **34** to chlorosulfonic acid at about  $-78\text{ }^\circ\text{C}$ , then warming to room temperature to form the sulfonyl chloride **35**. The sulfonyl chloride **35** is

15

reacted with aqueous ammonium hydroxide in a solvent, such as acetone, at about 5 °C, and then at room temperature to form the sulfonamide 36. In step 3, the sulfonamide 36 is selectively brominated, such as with a solution of 30% HBr in acetic acid, acetic acid and bromine to form the bromoketone 37. In Step 4, the bromoketone 37 is added to an acid and potassium carbonate in dimethylacetamide to give the desired crude  $\alpha$ -acyloxy ketone 38. In step 5, acetic acid and ammonium acetate are added to the acyloxy ketone 38, and heated, such as at about 100 °C to give the oxazole 39.

## EXAMPLE 1

15

4-(4-Fluorophenyl)-2-(2-phenylethyl)-5-(4-(methylsulfonyl)phenyl)oxazole

20

Step 1: Preparation of 1-(4-fluorophenyl)-2-hydroxy-2-(methylsulfonyl)phenyl)ethanone

A suspension of 2.03 g sodium hydride in 125 mL tetrahydrofuran (THF) was stirred at 0°C under a nitrogen atmosphere as a solution containing 20.0 g of 1-(4-fluorophenyl)-2-[4-(methylthio)phenyl]ethanone, as prepared in U.S. Patent No. 3,647,858, in 100 mL of THF was added dropwise over 30 minutes. The reaction was allowed to warm to 25°C for 18 hours. A solution containing 12.7 g (84.5 mmol) of *tert*-butyl-

25

30

dimethylsilyl chloride (DBSCL) in 20 mL THF was added over 5 minutes and the resulting solution stirred at 25°C for 18 hours. The reaction was quenched by pouring into aqueous sodium bicarbonate. The mixture was  
5 extracted with ethyl acetate and the combined organic extracts dried over sodium sulfate. Concentration *in vacuo* provides a yellow oil, which solidified on standing to give 27.9 g of the silyl enol ether. NMR spectra was consistent with the assigned structure. The  
10 silyl enol ether was used without further purification.

A solution containing 27.9 g of the silyl enol ether in 500 mL methylene chloride ( $\text{CH}_2\text{Cl}_2$ ) was cooled to 0°C under a nitrogen atmosphere while being stirred mechanically. 77.1g of *m*-chloroperoxybenzoic acid  
15 (technical grade, 50-60%) was added and the reaction was stirred at 0°C for 2 hours and allowed to warm to 25°C over 1 hour. The reaction mixture was washed with an aqueous solution of sodium metabisulfite, followed by aqueous sodium bicarbonate. The organic solution was  
20 dried over sodium sulfate and concentrated *in vacuo* to give 24.5 g of 1-(4-fluorophenyl)-2-tert-butyl dimethylsilyloxy-2-[4-(methylsulfonyl)phenyl]ethanone. NMR spectra were consistent with the assigned structure. This material  
25 was used without further purification.

The benzoin silyl ether was dissolved in 100 mL of 90% aqueous trifluoroacetic acid and stirred at 25°C for 18 hours. The reaction was quenched by slowly pouring into saturated aqueous sodium bicarbonate solution. The  
30 product was extracted with ethyl acetate and the combined organic extracts were dried over sodium sulfate. Concentration *in vacuo* provided an oily solid, which was recrystallized from 50% ethyl acetate/isooctane to give 15.5 g of a crystalline white  
35 solid (mp 122-123°C) whose structure was assigned as 1-(4-fluorophenyl)-2-hydroxy-2-

(methylsulfonyl)phenyl)ethanone on the basis of its spectral properties.

The isomeric benzoin, 2-(4-fluorophenyl)-2-hydroxy-1-(4-(methylsulfonyl)phenyl)ethanone, was prepared analogously from 2-(4-fluorophenyl)-1-[4-(methylthio)phenyl] ethanone.

Step 2: Preparation of 4-(4-fluorophenyl)-2-(2-phenylethyl)-5-(4-(methylsulfonyl)phenyl)oxazole.

10 A solution containing 5.00 g of 1-(4-fluorophenyl)-2-hydroxy-2-(4-(methylsulfonyl)phenyl)ethanone in 100 mL methylene chloride ( $\text{CH}_2\text{Cl}_2$ ) was stirred at 25°C as 6.60 mL of pyridine was added, followed by 3.61 mL of hydrocinnamoyl chloride.

15 The reaction was stirred at 25°C for 48 hours, after which the organic solution was washed with 1N HCl, dried over sodium sulfate and concentrated *in vacuo* to give an oily solid. This material was recrystallized from 50% ethyl acetate/isooctane to give 4.40 g of a  
20 beige crystalline solid (mp 152-153.5°C). NMR spectra were consistent with the assigned structure of 1-(4-fluorophenyl)-2-[4-(methylsulfonyl)phenyl]-2-(2-phenyl)propionyloxy ethanone. This material was dissolved in 100 mL of glacial acetic acid and 7.70 g of  
25 ammonium acetate was added. The reaction was heated to reflux with stirring for 1.5 hours, after which it was cooled to room temperature and poured into 100 mL of water. The product was extracted with ethyl acetate and the combined organic extracts washed with aqueous sodium  
30 bicarbonate, dried over sodium sulfate and concentrated *in vacuo* to give an oily solid which was recrystallized from 50% ethyl acetate/isooctane to give 3.55 g of 4-(4-fluorophenyl)-2-(2-phenylethyl)-5-(4-(methylsulfonyl)phenyl)oxazole as a white crystalline solid (mp 117-  
35 118°C). NMR spectra was consistent with the assigned structure.

A solution containing 2.87 g (5.92 mmol) of the benzoin ester and 5.3 g (69 mmol) of ammonium acetate in 100 mL of acetic acid was heated to 80°C for 2 hours. The reaction was cooled to 25°C and poured into water.

The product was extracted into ethyl acetate and the combined organic extracts washed with an aqueous solution of sodium bicarbonate. The solution was dried over sodium sulfate and concentrated in vacuo to give the crude oxazole. This crude material was purified by flash chromatography on a silica gel column using 25% ethyl acetate/hexane as the eluent to give 1.87 g (68%) of a clear oil, which was characterized as 2-(2-cyclohexylethyl)-4-(4-fluorophenyl)-5-[4-(methythio)phenyl]oxazole on the basis of its spectral properties:  $^1\text{H-NMR}$  ( $\text{CDCl}_3$ , 400 MHz)  $\delta$  0.90-1.02 (m, 2H), 1.10-1.40 (m, 4H), 1.62-1.82 (m, 7H), 2.49 (s, 3H), 2.84 (t,  $J=8.0$  Hz, 2H), 7.03 (d,  $J=8.7$ Hz, 1H), 7.06 (d,  $J=8.7$ Hz, 1H), 7.22 (d,  $J=8.6$ Hz, 2H), 7.45 (d,  $J=8.6$ Hz, 2H), 7.58 (d,  $J=5.4$ Hz, 1H), 7.61 (d,  $J=5.4$ Hz, 1H). The material from this experiment was used directly in the next step without further purification.

A solution of 1.87g (4.73 mmol) of 2-(2-cyclohexylethyl)-4-(4-fluorophenyl)-5-[4-(methythio)phenyl]oxazole in 100 mL of methylene chloride was stirred at  $-78^\circ\text{C}$  as 3.26 g (9.46 mmol based on 50% purity) of *m*-chloroperoxybenzoic acid was added all at once. The reaction was stirred at  $-78^\circ\text{C}$  for 1 hour and TLC (silica, 50% hexane/ethyl acetate) indicated that the reaction mixture consisted of mostly sulfone. The reaction was poured into a solution of aqueous sodium metabisulfite. The aqueous solution was extracted using ethyl acetate and the organic layer was washed with saturated sodium metabisulfite, saturated sodium bicarbonate and brine. The resulting clear solution was dried over sodium sulfate and concentrated in vacuo to give a white solid which was purified by flash chromatography on a silica gel column using 50% ethyl acetate/hexane as the eluent. Recrystallization from 50% ethyl acetate/isooctane gave 1.76 g (87%) of a low melting semi-solid whose structure was assigned as 2-(2-cyclohexylethyl)-4-(4-fluorophenyl)-5-[4-

### EXAMPLE 33

Ethyl 2-[4-(4-fluorophenyl)-5-[4-(methylsulfonyl)phenyl]-2-oxazolyl]-2-benzyl-acetate

Step 1: Preparation of 2-(4-fluorophenyl)-3-(4-methylthiophenyl)propenoic acid

Acetic anhydride (500 mL), 4-(methylthio)benzaldehyde (100.2 g, 0.66 mol), 4-fluorophenylacetic acid (101.6 g, 0.66 mol), and triethylamine (68.1 g, 0.67 mol) were placed in a 3 L round bottom flask and heated to reflux for 1.75 hours. The reaction was cooled to  $110^\circ\text{C}$ , and water (500 mL) was added cautiously through an addition funnel. This caused the solution to reflux vigorously and the temperature to rise to  $135^\circ\text{C}$ . A yellow precipitate

formed, and after cooling to room temperature, was collected by filtration, washed with water, and recrystallized from ethyl acetate/isooctane to provide the diarylacrylic acid as yellow needles (135.2 g, 71%):

5 mp 172-176°C.  $^1\text{H}$  NMR (acetone  $d_6$ ) 300 MHz 7.84 (s, 1H), 7.03-7.28 (m, 10H), 2.46 (s, 3H).  $^{19}\text{F}$  NMR (acetone  $d_6$ ) -116.11 (m). Mass spectrum  $M^+$  288.

10 Step 2: Preparation of 1-(4-fluorophenyl)-2-(4-methylthiophenyl)ethanone

The diaryl acrylic acid (226.5 g, 0.78 mol) was placed in a 2 L round bottom flask with anhydrous toluene (800 mL) and triethylamine (81.2 g, 0.80 mol). After cooling to 0°C, diphenylphosphoryl azide (217.4 g, 15 0.79 mol) was added, the solution was stirred at 0°C for 20 minutes and at room temperature for 2.50 hours. The reaction was poured into water, extracted with ether, dried over magnesium sulfate, and concentrated *in vacuo* to remove the ether. The remaining toluene solution was 20 heated to reflux and a vigorous evolution of gas occurred. After 1.25 hours, *tert*-butyl alcohol (80 mL, 0.84 mol) was added to the reaction. After an additional 20 minutes, concentrated hydrochloric acid (41 mL) was added slowly causing the reaction to foam. 25 The reaction was heated at 90°C overnight (14 hours) and a white precipitate formed after cooling. The precipitate was isolated by filtration, washed with cold ether, and air dried to yield the desired intermediate (182.7 g, 89%): mp 134.5-138°C.  $^1\text{H}$  NMR (acetone  $d_6$ ) 300 30 MHz 8.16 (m, 2H), 7.24 (m, 6H), 4.34 (s, 2H), 2.46 (s, 3H).  $^{19}\text{F}$  NMR (acetone  $d_6$ ) -107.88 (m).

35 Step 3: Preparation of 1-(4-fluorophenyl)-2-(4-methylthiophenyl)-2-hydroxy-ethanone

A 1 L three necked round bottomed flask equipped with reflux condenser, magnetic stir bar, thermometer adapter, and constant pressure addition funnel was

charged with the intermediate from Step 2, (55.5 g, 0.21 mol), acetic acid (250 mL) and 33% HBr in acetic acid (120 mL). The solution was stirred and treated with bromine (11.1 mL, 0.21 mol) from the addition funnel at such a rate that the bromine color was discharged rapidly, ca. 15 minutes. After an additional 10 minutes at room temperature, the solution was filtered through a Buchner funnel and the filtrate concentrated *in vacuo* to give an orange solid. The crude bromoketone was dissolved in dichloromethane and washed with 1N NaHSO<sub>3</sub>, dried over anhydrous MgSO<sub>4</sub>, filtered and concentrated *in vacuo* to give 68.8 g of 1-(4-fluorophenyl)-2-(4-methylthiophenyl)-2-bromoethanone as a yellow solid which was used directly without further purification. The crude bromoketone was dissolved in 300 mL acetone and 150 mL of water and heated to reflux for 2.5 hours. The solution was concentrated *in vacuo* and the residue taken up in dichloromethane, washed with saturated aqueous sodium bicarbonate, brine, dried over anhydrous magnesium sulfate, filtered and reconcentrated *in vacuo* to give a light yellow solid that was crystallized from a mixture of dichloromethane and isooctane to provide 37.8 g (65%) of pure 1-(4-fluorophenyl)-2-(4-methylthiophenyl)-2-hydroxy-ethanone: mp 90-92 °C.

Step 4: Preparation of ethyl 2-[4-(4-fluorophenyl)-5-[4-methylthio)phenyl]]-2-oxazoleacetate

A solution containing 8.00 g (29 mmol) of 1-(4-fluorophenyl)-2-hydroxy-2-[4-(methylthiophenyl)ethanone in 100 mL of methylene chloride was stirred at 25°C as 7.0 mL (31 mmol) of pyridine was added, followed by the addition of 4.5 mL (35 mmol) of ethyl malonyl chloride. The reaction was stirred at 25°C for 48 hours, after which the resulting yellow solution was washed with 1N HCl, dried over sodium sulfate and concentrated *in vacuo*. The crude solid was purified via flash chromatography on a silica gel column using 10% ethyl

acetate/hexane as the eluent. This provided 7.31 g (64%) of a white foam, which was used directly without further purification. The product from above (7.31 g, 18.7 mmol) and 7.2 g of ammonium acetate (93.5 mmol, 5 equivalents) in 50 mL of glacial acetic were heated to reflux for 2 hours. The reaction mixture was cooled to 25°C and poured into 100 mL of water. The aqueous solution was extracted with ethyl acetate and the combined organic extracts were washed with water and sodium bicarbonate solution, dried over sodium sulfate and concentrated in vacuo. The crude solid was purified by flash chromatography using a silica gel column and 20% ethyl acetate/hexane as the eluent to give a white solid which was recrystallized from 50% ethyl acetate/isooctane to give 5.55 g (80%) of a white solid whose structure was assigned as ethyl 2-[4-(4-fluorophenyl)-5-[4-methylthio)phenyl]oxazol-2-yl]acetate and was judged suitable for taking onto the next step.

A solution of 755 mg (2.03 mmol) of ethyl 2-[4-(4-fluorophenyl)-5-[4-methylthio]phenyl]oxazol-2-yl]acetate (from Step 4) was dissolved in 20 mL of anhydrous tetrahydrofuran (THF) and cooled to -78°C and treated with a solution of potassium bis(trimethylsilyl)amide (2.44 mL, 1.2 equivalents, 1M in THF via syringe. The solution was maintained at -78°C for 15 minutes and treated with a solution of 290  $\mu$ L (2.44 mmol) of benzyl bromide. The solution was warmed to room temperature and poured into a saturated aqueous solution of ammonium chloride. The aqueous solution was extracted with ethyl acetate, washed with brine, dried over anhydrous sodium sulfate, filtered and concentrated *in vacuo* to give an oil that was purified by flash chromatography on silica gel eluting with 10% ethyl acetate/hexane to provide 396 mg of the dealkylated product and 182 mg (19%) of ethyl 2-[4-(4-fluorophenyl)-5-[4-methylthio]phenyl]oxazol-2-yl]-1-benzyl-acetate that was used directly in the next step. A solution of 182 mg (0.344 mmol) of ethyl 2-[4-(4-fluorophenyl)-5-[4-methylthio]phenyl]oxazol-2-yl]-1-benzyl-acetate in 5 mL of dichloromethane was cooled to -78°C and treated with 272 mg (2 equivalents) of *m*-chloroperoxybenzoic acid for 2 hours. The reaction was poured into a solution of aqueous sodium metabisulfite. The aqueous solution was extracted using ethyl acetate and the organic layer was washed with saturated sodium metabisulfite, saturated sodium bicarbonate and brine. The resulting clear solution was dried over sodium sulfate and concentrated *in vacuo* to give a transparent oil which was purified by flash chromatography on a silica gel column using 30% ethyl acetate/hexane as the eluent. 10            A solution of 4-chlorobenzaldehyde (9.86 g, 70 mmol) and zinc iodide (0.18 g) in dichloromethane (40 mL) was treated with a solution of trimethylsilylcyanide (9 mL, 71 mmol) in dichloromethane (20 mL). The solution was stirred for 0.33 hours at room temperature, washed with water and saturated

15            NaHCO<sub>3</sub>, dried over MgSO<sub>4</sub>, and concentrated in vacuo to give the trimethylsilyl cyanohydrin as an orange oil (13.90 g). The trimethylsilyl cyanohydrin was dissolved in diethyl ether (50 mL) and added dropwise to a solution of phenylmagnesium bromide (69 mmol) in diethyl ether (269 mL) while maintaining

20            the temperature between 15-28 °C with an ice water bath. The reaction was stirred for 0.75 hours at room temperature then quenched by adding 3N HCl (50 mL). The organic layer was collected, washed with saturated NaHCO<sub>3</sub> and brine, dried over MgSO<sub>4</sub>, and concentrated in vacuo to give a yellow solid

25            (13.06 g). The yellow solid was dissolved in 9:1 trifluoroacetic acid/water (30 mL) and stirred for 1.6 hours

The reaction was neutralized with solid sodium carbonate, extracted with ethyl acetate, washed with 10%  $\text{Na}_2\text{CO}_3$  and brine, dried over  $\text{MgSO}_4$ , concentrated in *vacuo* to give a yellow solid (9.43 g) and used in the next step without further purification.

Step 2. Preparation of 2-trifluoromethyl-4-phenyl-5-(4-chlorophenyl)oxazole.

Trifluoroacetonitrile (1.5 g, 15.8 mmol) was bubbled into DMF (100 mL). This solution was cooled to 0 °C and 4'-chlorobenzoin (Example 37, Step 1) (2.5 g, 10 mmol) was added. DBU (1.83 g, 12 mmol) was added and the solution was warmed to room temperature for 4 hours. The reaction was heated to approximately 100 °C for an additional 4 hours. The solution was cooled to room temperature, poured into 400 mL 1N HCl and extracted with 500 mL ethyl acetate. The organics were washed consecutively with 1N HCl (400 mL),  $\text{NaHCO}_3$  (saturated) (400 mL) and brine (400 mL), dried over  $\text{Na}_2\text{SO}_4$  and concentrated. ## Example 115

5    4-[(4-Aminosulfonyl)phenyl]-5-(4-fluorophenyl)oxazole-  
2-pentanoic acid

Step 1: Preparation of 2-(4-fluorophenyl)-2-hydroxy-1-phenylethanone

10        4-Fluorobenzaldehyde (25 g, 0.2 mol) and zinc iodide  
(0.14 g, 0.4 mmol) were mixed with 100 mL of methylene  
chloride. Trimethylsilyl cyanide (20.6 g, 0.21 mol) was  
dissolved in 30 mL of methylene chloride and added over 30  
minutes. The reaction mixture was stirred at room  
15    temperature for 1 h. The reaction mixture was diluted with  
200 mL of methylene chloride, and the organic phase was  
washed with saturated aqueous sodium bicarbonate (1 x 150  
mL), saturated brine (1 x 150 mL), dried over magnesium  
sulfate, filtered, concentrated and vacuum dried to give 47.3  
20    g of the desired trimethylsilyl cyanohydrin as a yellow  
liquid.

The trimethylsilyl cyanohydrin (45 g, 0.2 mol) was  
diluted with 100 mL of ether and added to a solution of  
phenylmagnesium bromide (72 mL of 3.0 M solution in ether,  
25    0.215 mol) in 600 mL of diethyl ether over 1.5 h at room  
temperature. The reaction mixture was stirred for 3 h at  
room temperature and slowly quenched with 3 N HCl (300 mL).  
The organic layer was separated and washed with saturated  
sodium bicarbonate (1 x 300 mL), saturated brine (1 x 300  
30    mL), dried over magnesium sulfate, filtered, concentrated,  
and vacuum dried to give 43.2 g of a brown oil. This oil was  
treated with 150 mL of 9:1 trifluoroacetic acid in water for

3 h at room temperature. Excess saturated aqueous sodium carbonate was slowly added to the reaction mixture, followed by water (200 mL). The aqueous solution was extracted with ether (2 x 200 mL). The combined organic layers were washed with saturated sodium bicarbonate (1 x 200 mL), saturated brine (1 x 200 mL), dried over magnesium sulfate, filtered and concentrated. The crude material was crystallized from ethyl acetate and hexane to give 17.4 g (38%) of 2-(4-fluorophenyl)-2-hydroxy-1-phenylethanone as a yellow solid: m.p. 91-94 °C. HRMS (calcd for C<sub>14</sub>H<sub>11</sub>FO<sub>2</sub> 231.0831) 231.0835.

Step 2 Preparation of methyl 4-[(4-aminosulfonyl)phenyl]-5-(4-fluorophenyl)oxazole-2-pentanoate

5-(Methoxycarbonyl)pentanoyl chloride (6.5 g, 0.036 mol) in 10 mL of methylene chloride and triethylamine (7.1 g, 0.07 mol) was added to 2-(4-fluorophenyl)-2-hydroxy-1-phenylethanone (Step 1) (8 g, 0.035 mol) in 100 mL of methylene chloride. The resulting mixture was stirred for 2 h at room temperature, diluted with 200 mL of methylene chloride, washed with water (1 x 100 mL), and saturated brine (1 x 100 mL), dried over magnesium sulfate, filtered and concentrated. The concentrated residue was dried under vacuum to give 12.2 g of crude ester intermediate. Acetic acid (50 mL) and ammonium acetate (10.2 g, 0.132 mol) were added to this ester intermediate (12.2 g, 0.033 mol). The resulting mixture was heated for 3 h at 100 °C. The reaction mixture was cooled to room temperature, and the excess acetic acid was removed under vacuum. The resulting residue was partitioned between water (150 mL) and ethyl acetate (300 mL). The organic layer was separated, washed with saturated aqueous sodium bicarbonate (2 x 150 mL), saturated brine (2 x 150 mL), dried over magnesium sulfate, filtered and concentrated. The concentrated residue was purified by flash chromatography on silica gel (eluting with 1: 9 ethyl acetate:hexane) to give 7 g (60%) of pure methyl 4-(phenyl)-5-(4-fluorophenyl)oxazole-2-pentanoate as a yellow oil.

Chlorosulfonic acid (38.6 g, 0.33 mol) was slowly added to methyl 4-(phenyl)-5-(4-fluorophenyl)oxazole-2-pentanoate (4.7 g, 0.013 mol) at 5 °C. The ice bath was removed, and the reaction mixture was stirred for 3 h at room temperature. The reaction mixture was diluted with methylene chloride (200 mL) and poured slowly into ice. The organic layer was separated and added to ammonium hydroxide (50 mL) at room temperature. The reaction mixture was stirred for 30 minutes at room temperature. The organic layer was separated and washed with water (1 x 200 mL), brine (1 x 200 mL), dried over magnesium sulfate, filtered and concentrated. The concentrated residue was purified by flash chromatography on silica gel (eluting with 9:11 ethyl acetate:hexane) to give 0.74 g (13%) of methyl 4-[(4-aminosulfonyl)phenyl]-5-(4-fluorophenyl)-oxazole-2-pentanoate as a pale yellow solid: m.p. 82.4-87.4 °C. <sup>1</sup>H NMR (CDCl<sub>3</sub>/300 MHz) 1.74-1.95 (m, 4H), 2.40 (t, 2H, J = 7.25 Hz), 2.88 (t, 2H, J = 7.35 Hz), 3.67 (s, 3H), 4.93 (bs, 2H), 7.07-7.13 (m, 2H), 7.50-7.55 (m, 2H), 7.75 (d, 2H, J = 8.66 Hz), 7.89 (d, 2H, J = 8.66 Hz). <sup>19</sup>F NMR (CDCl<sub>3</sub>/300 MHz) -111.22 to -111.127 ppm. Step 3: Preparation of 4-[(4-aminosulfonyl)phenyl]-5-(4-fluorophenyl)-oxazole-2-pentanoic acid

Methyl 4-[(4-aminosulfonyl)phenyl]-5-(4-fluorophenyl)oxazole-2-pentanoate (Step 2) (0.51 g, 1.2 mmol) was dissolved in 30 mL of 1:1 THF/methanol. Lithium hydroxide (0.2 g, 4.7 mmol) and 1 mL of water were added. The reaction mixture was stirred for four days at room temperature, then the solvents were removed at reduced pressure. The concentrated residue was partitioned between ethyl acetate (100 mL) and 3 N HCl (100 mL) in a separatory funnel and shaken vigorously. The organic layer was separated and washed with saturated brine (1 x 100 mL), dried over magnesium sulfate, filtered and concentrated. The concentrated residue was crystallized from ethyl acetate and hexane to give 0.4 g (81%) of 4-[(4-aminosulfonyl)phenyl]-5-

(4-fluorophenyl)oxazole-3-pentanoic acid as a white solid:  
 m.p. 153-154.5 °C.  $^1\text{H}$  NMR ( $\text{CD}_3\text{OD}/300\text{ MHz}$ ) 1.69-1.79 (m, 2H),

## Example 123

5            4-[(4-Methylsulfonyl)phenyl]-5-(3,4-dichlorophenyl)oxazole-2-butanoic acid

Step 1: Preparation of 2-(3,4-dichlorophenyl)-2-hydroxy-1-[(4-methylthio)-phenyl]ethanone

10            Trimethylsilyl cyanide (14.6 g, 0.147 mol) was diluted with 30 mL of methylene chloride and added to a solution of 3,4-dichlorobenzaldehyde (25 g, 0.143 mol) in 100 mL of methylene chloride over 20 minutes. The reaction mixture was stirred at room temperature for 1  
15 h. The reaction mixture was diluted with 200 mL of methylene chloride, and the organic solution was washed with saturated sodium bicarbonate (2 x 150 mL), saturated brine (2 x 150 mL), dried over magnesium sulfate, filtered and concentrated to give 39 g of a  
20 brown oil, which was used in the next reaction without further purification.

              Magnesium (1.8 g, 0.073 mol) was suspended in ether (20 mL), and iodomethane (0.1 mL) was added. 4-Bromothioanisole (14.8 g, 0.073 mol), dissolved in 100  
25 mL of ether, was added over 50 min., and the reaction mixture was stirred overnight at room temperature. The cyanohydrin (10 g, 0.036 mol) was diluted with 100 mL of ether and added to the pre-formed Grignard reagent over a 1 h period. The reaction mixture was stirred for 3 h  
30 at room temperature. The reaction was slowly quenched

with 50 mL of 3 N HCl and the aqueous layer was removed by separation. The organic layer was washed with water (2 x 100 mL), saturated sodium bicarbonate (1 x 100 mL), saturated brine (1 x 100 mL), dried over magnesium sulfate, filtered and concentrated. A solution of 9:1 trifluoroacetic acid:water (50 mL) was added to the concentrated residue, and the mixture was stirred for 1.5 h at room temperature. The reaction mixture was neutralized by adding solid sodium carbonate. Water (300 mL) and ether (300 mL) were added. The ether layer was separated and washed with saturated sodium bicarbonate (2 x 150 mL), saturated brine (2 x 150 mL), dried over magnesium sulfate, filtered and concentrated. The crude material was purified by flash chromatography on silica gel eluting with 1:9 ethyl acetate:hexane to give 3.3 g (28%) of the desired benzoin as a yellow oil. This yellow oil was crystallized from hexane and ethyl acetate to give 0.46 g of 2-(3,4-dichlorophenyl)-2-hydroxy-1-[(4-methylthio)phenyl]ethanone as a white solid: m.p. 54-58 °C. HRMS (calcd for C<sub>15</sub>H<sub>12</sub>O<sub>2</sub>SCl<sub>2</sub> 327.0013) 327.0024.

Step 2: Preparation of methyl 4-[(4-methylthio)phenyl]-5-(3,4-dichlorophenyl)oxazole-2-butanoate

5-(Methoxycarbonyl)pentanoyl chloride (1.63 g, 9.9 mmol) was diluted with 20 mL of methylene chloride and was added to a solution of 2-(3,4-dichloro-phenyl)-2-hydroxy-1-[(4-methylthio)phenyl]ethanone (Step 1) (3.24 g, 9.9 mmol) in 60 mL of methylene chloride containing triethylamine (2 g, 0.02 mmol). The reaction mixture was stirred for 1.5 h at room temperature. The reaction mixture was diluted with 100 mL of methylene chloride and washed with water (1 x 100 mL), saturated brine (1 x 100 mL), dried over magnesium sulfate, filtered, concentrated and dried under high vacuum. Acetic acid

(10 mL) and ammonium acetate (3.05 g, 0.04 mol) were added to this concentrated residue, and the mixture was heated at 100 °C for 3 h. The reaction mixture was cooled to room temperature, and the excess acetic acid was removed under vacuum. The resulting residue was partitioned between water (100 mL) and ethyl acetate (200 mL). The organic layer was separated, washed with saturated aqueous sodium bicarbonate (2 x 100 mL), saturated brine (1 x 100 mL), dried over magnesium sulfate, filtered and concentrated. The concentrated residue was purified by flash chromatography on silica gel (eluting with 1:4 ethyl acetate:hexane) to give 2.14 g (50%) of methyl 4-[(4-methylthio)phenyl]-5-(3,4-dichlorophenyl)oxazole-2-butanoate as a yellow oil.

Step 1. Preparation of 2-[(4-aminosulfonyl)phenyl]-1-(p-fluorophenyl)ethanone.

Neat 2-(phenyl)-1-(p-fluorophenyl)ethanone (6.10 g, 28.54 mmol) was cooled to  $-78^{\circ}\text{C}$  in a dry ice methanol bath. Chlorosulfonic acid (15.0 mL) was added, and the solution was warmed to room temperature over 1 h. The solution was stirred for 2 h and poured directly into ice. The resulting heterogenous aqueous solution was extracted with ethyl acetate (2 x 300 mL). ### 4-[2-Ethyl-4-(3-fluorophenyl)-oxazol-5-yl]benzenesulfonamide

#### Step 1: Preparation of 1-(3-fluorophenyl)-2-phenyl-ethan-1-one

3-Fluorobenzaldehyde (10.0 g, 81 mmol), dichloromethane (100 mL), and zinc iodide (5 mg) were stirred at 0 °C under nitrogen. Trimethylsilyl cyanide (8.83 g, 89 mmol) was added dropwise with a slight exotherm. The cooling bath was removed and the reaction proceeded for 2 hours when water (5 mL) was added dropwise. The mixture was washed with brine (2 X 30 mL), dried over magnesium sulfate, and concentrated under high vacuum. The resulting oily residue was dissolved in tetrahydrofuran (150 mL) and cooled to -78 °C under nitrogen. Lithium diisopropylamine (2.0 M solution in heptane/tetrahydrofuran/ethylbenzene, 45 mL, 90 mmol) was added dropwise maintaining the temperature below -60 °C.

The reaction was stirred for 1/2 hour and benzyl bromide was added (15.4 g, 90 mmol) all at once. The cooling bath was removed and the mixture was stirred until the temperature reached -15 °C and poured into a stirred solution of 1N hydrochloric acid (150 mL) and trifluoroacetic acid (10 mL). After one hour, the mixture was extracted with ethyl acetate (2 X 50 mL), combined, washed with brine (2 X 50 mL), and concentrated. The resulting dark oily residue was treated with 2.5 N sodium hydroxide, and a solid was collected by filtration. Recrystallization from ethanol/water resulted in 11.4 g of a light yellow solid: mp 54.6-57.0 °C. This material was used in the next step without further purification or characterization.

Step 2. Preparation of 1-(3-fluorophenyl)-2-bromo-2-phenyl-ethan-1-one

The mixture was concentrated and ethyl acetate (150 mL) was added. After washing with brine, drying over magnesium sulfate, and concentrating, 5.3 g of a brown oil was obtained. This material was used in the next step without further purification or characterization.

Step 3. Preparation of 2-ethyl-4-(3-fluorophenyl)-5-phenyloxazole.

1-(3-Fluorophenyl)-2-bromo-2-phenyl-ethan-1-one (Step 2) (1.5 g, 5.15 mmol), N',N'-dimethylformamide (25 mL), sodium hydroxide (60%, 0.23 mL, 5.67 mmol), and propionic acid (0.33 g, 5.67 mmol) were stirred at room temperature overnight. After the addition of ethyl acetate (100 mL), the mixture was washed successively with 1N hydrochloric acid, brine, and water. The organic

solution was dried over magnesium sulfate and concentrated. The resulting oily residue was dissolved in acetic acid (50 mL) and ammonium acetate (6.0 g) was added. After refluxing for 12 hours, the mixture was  
 5 concentrated, dissolved in ethyl acetate (100 mL), washed with brine, dried and concentrated. Purification by flash column chromatography (eluting with hexanes:ethyl acetate (20:1)) yielded 0.6 g of a light yellow oil which formed an oily solid upon standing:  $^1\text{H}$  NMR

15 Step 4: Preparation of 4-[2-ethyl-4-(3-fluorophenyl)-oxazol-5-yl]benzenesulfonamide

 20 dichloromethane and added dropwise. The mixture was stirred and warmed to room temperature over 5 hours, when it was added dropwise to ice (500 mL). Ammonium hydroxide (100 mL) and ethyl acetate (100 mL) were added and the mixture was stirred overnight. The layers were  
 25 separated and the organic phase was washed with 1 N hydrochloric acid, and brine. After drying over magnesium sulfate and concentrating, 0.4 g of a light yellow solid was recrystallized from ethanol water: mp  $133.5$ - $135.1^\circ\text{C}$ .  $^1\text{H}$  NMR (acetone- $d_6$ /300 MHz) 7.96 (d,  $J =$

### Rat Carrageenan Foot Pad Edema Test

The carrageenan foot edema test was performed with materials, reagents and procedures essentially as described by Winter, et al., (*Proc. Soc. Exp. Biol. Med.*, 111, 544 (1962)). Male Sprague-Dawley rats were selected in each group so that the average body weight was as close as possible. Rats were fasted with free access to water for over sixteen hours prior to the test. The rats were dosed orally (1 mL) with compounds suspended in vehicle containing 0.5% methylcellulose and 0.025% surfactant, or with vehicle alone. One hour later a subplantar injection of 0.1 mL of 1% solution of carrageenan/sterile 0.9% saline was administered and the volume of the injected foot was measured with a displacement plethysmometer connected to a pressure transducer with a digital indicator. Three hours after the injection of the carrageenan, the volume of the foot was again measured. The average foot swelling in a group of drug-treated animals was compared with that of a group of placebo-treated animals and the percentage inhibition of edema was determined (Otterness and Bliven, Laboratory Models for Testing NSAIDs, in Non-steroidal Anti-Inflammatory Drugs, (J. Lombardino, ed. 1985)). The % inhibition shows the % decrease from control paw volume determined in this procedure and the data for selected compounds in this invention are summarized in Table 6.

### Rat Carrageenan-induced Analgesia Test

The analgesia test using rat carrageenan was performed with materials, reagents and procedures essentially as described by Hargreaves, et al., (Pain, 32, 77 (1988)). Male Sprague-Dawley rats were treated as previously described for the Carrageenan Foot Pad Edema test. Three hours after the injection of the carrageenan, the rats were placed in a special plexiglass container with a transparent floor having a high

intensity lamp as a radiant heat source, positionable under the floor. After an initial twenty minute period, thermal stimulation was begun on either the injected foot or on the contralateral uninjected foot. A photoelectric cell turned off the lamp and timer when light was interrupted by paw withdrawal. The time until the rat withdraws its foot was then measured. The withdrawal latency in seconds was determined for the control and drug-treated groups, and percent inhibition of the hyperalgesic foot withdrawal determined. Results are shown in Table 6.

#### Evaluation of COX I and COX II activity *in vitro*

The compounds of this invention exhibited inhibition *in vitro* of COX-2. The COX-2 inhibition activity of the

compounds of this invention illustrated in the Examples was determined by the following methods.

a. Preparation of recombinant COX baculoviruses

5        Recombinant COX-1 and COX-2 were prepared as described by Gierse et al, [*J. Biochem.*, 305, 479-84 (1995)]. A 2.0 kb fragment containing the coding region of either human or murine COX-1 or human or murine COX-2 was cloned into a BamHI site of the baculovirus transfer  
10        vector pVL1393 (Invitrogen) to generate the baculovirus transfer vectors for COX-1 and COX-2 in a manner similar to the method of D.R. O'Reilly et al (*Baculovirus Expression Vectors: A Laboratory Manual* (1992)). Recombinant baculoviruses were isolated by transfecting 4  
15        µg of baculovirus transfer vector DNA into SF9 insect cells ( $2 \times 10^8$ ) along with 200 ng of linearized baculovirus plasmid DNA by the calcium phosphate method. See M.D. Summers and G.E. Smith, *A Manual of Methods for Baculovirus Vectors and Insect Cell Culture Procedures*,  
20        Texas Agric. Exp. Station Bull. 1555 (1987). Recombinant viruses were purified by three rounds of plaque purification and high titer ( $10^7$  -  $10^8$  pfu/ml) stocks of virus were prepared. For large scale production, SF9  
insect cells were infected in 10 liter fermentors ( $0.5 \times 10^6$ /ml) with the recombinant baculovirus stock such that  
25        the multiplicity of infection was 0.1. After 72 hours the cells were centrifuged and the cell pellet homogenized in Tris/Sucrose (50 mM: 25%, pH 8.0) containing 1% 3-[(3-cholamidopropyl)dimethylammonio]-1-propanesulfonate (CHAPS). The homogenate was centrifuged  
30        at 10,000xG for 30 minutes, and the resultant supernatant was stored at -80°C before being assayed for COX activity.

35        b. Assay for COX-1 and COX-2 activity

COX activity was assayed as PGE<sub>2</sub> formed/ $\mu$ g protein/time using an ELISA to detect the prostaglandin released. CHAPS-solubilized insect cell membranes containing the appropriate COX enzyme were incubated in a potassium phosphate buffer (50 mM, pH 8.0) containing epinephrine, phenol, and heme with the addition of arachidonic acid (10  $\mu$ M). Compounds were pre-incubated with the enzyme for 10-20 minutes prior to the addition of arachidonic acid. Any reaction between the arachidonic acid and the enzyme was stopped after ten minutes at 37°C/room temperature by transferring 40  $\mu$ l of reaction mix into 160  $\mu$ l ELISA buffer and 25  $\mu$ M indomethacin. The PGE<sub>2</sub> formed was measured by standard ELISA technology (Cayman Chemical). Results are shown in Table 7.

Also embraced within this invention is a class of pharmaceutical compositions comprising the active compounds of this combination therapy in association with one or more non-toxic, pharmaceutically-acceptable carriers and/or diluents and/or adjuvants (collectively referred to herein as "carrier" materials) and, if desired, other active ingredients. The active compounds of the present invention may be administered by any suitable route, preferably in the form of a pharmaceutical composition adapted to such a route, and in a dose effective for the treatment intended. The active compounds and composition may, for example, be administered orally, intravascularly (IV), intraperitoneally, subcutaneously, intramuscularly (IM) or topically.

For oral administration, the pharmaceutical composition may be in the form of, for example, a tablet, hard or soft capsule, lozenges, dispensable powders, suspension or liquid. The pharmaceutical composition is preferably made in the form of a dosage unit containing a particular amount of the active ingredient. Examples of such dosage units are tablets or capsules.

The active ingredient may also be administered by injection (IV, IM, subcutaneous or jet) as a composition wherein, for example, saline, dextrose, or water may be used as a suitable carrier. The pH of the composition  
5 may be adjusted, if necessary, with suitable acid, base, or buffer. Suitable bulking, dispersing, wetting or suspending agents, including mannitol and PEG 400, may also be included in the composition. A suitable parenteral composition can also include a compound  
10 formulated as a sterile solid substance, including lyophilized powder, in injection vials. Aqueous solution can be added to dissolve the compound prior to injection.

The amount of therapeutically active compounds that are administered and the dosage regimen for treating a  
15 disease condition with the compounds and/or compositions of this invention depends on a variety of factors, including the age, weight, sex and medical condition of the subject, the severity of the inflammation or inflammation related disorder, the route and frequency of  
20 administration, and the particular compound employed, and thus may vary widely. The prodrug compositions should include similar dosages as for the parent compounds. The pharmaceutical compositions may contain active ingredients in the range of about 0.1 to 1000 mg,  
25 preferably in the range of about 0.5 to 250 mg and most preferably between about 1 and 60 mg. A daily dose of about 0.01 to 100 mg/kg body weight, preferably between about 0.05 and about 20 mg/kg body weight and most preferably between about 0.1 to 10 mg/kg body weight, may  
30 be appropriate. The daily dose can be administered in one to four doses per day.

In the case of skin conditions, it may be preferable to apply a topical preparation of compounds of this invention to the affected area two to four times a day.

35 For disorders of the eye or other external tissues, e.g., mouth and skin, the formulations are preferably

applied as a topical gel, spray, ointment or cream, or as a suppository, containing the active ingredients in a total amount of, for example, 0.075 to 30% w/w, preferably 0.2 to 20% w/w and most preferably 0.4 to 15% w/w. When formulated in an ointment, the active ingredients may be employed with either paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with an oil-in-water cream base. If desired, the aqueous phase of the cream base may include, for example at least 30% w/w of a polyhydric alcohol such as propylene glycol, butane-1,3-diol, mannitol, sorbitol, glycerol, polyethylene glycol and mixtures thereof. The topical formulation may desirably include a compound which enhances absorption or penetration of the active ingredient through the skin or other affected areas. Examples of such dermal penetration enhancers include dimethylsulfoxide and related analogs. The compounds of this invention can also be administered by a transdermal device. Preferably topical administration will be accomplished using a patch either of the reservoir and porous membrane type or of a solid matrix variety. In either case, the active agent is delivered continuously from the reservoir or microcapsules through a membrane into the active agent permeable adhesive, which is in contact with the skin or mucosa of the recipient. If the active agent is absorbed through the skin, a controlled and predetermined flow of the active agent is administered to the recipient. In the case of microcapsules, the encapsulating agent may also function as the membrane. The transdermal patch may include the compound in a suitable solvent system with an adhesive system, such as an acrylic emulsion, and a polyester patch.

The oily phase of the emulsions of this invention may be constituted from known ingredients in a known manner. While the phase may comprise merely an

emulsifier. it may comprise a mixture of at least one emulsifier with a fat or an oil or with both a fat and an oil. Preferably, a hydrophilic emulsifier is included together with a lipophilic emulsifier which acts as a  
5 stabilizer. It is also preferred to include both an oil and a fat. Together, the emulsifier(s) with or without stabilizer(s) make-up the so-called emulsifying wax, and the wax together with the oil and fat make up the so-called emulsifying ointment base which forms the oily  
10 dispersed phase of the cream formulations. Emulsifiers and emulsion stabilizers suitable for use in the formulation of the present invention include Tween 60, Span 80, cetostearyl alcohol, myristyl alcohol, glyceryl monostearate, and sodium lauryl sulfate, among others.

15 The choice of suitable oils or fats for the formulation is based on achieving the desired cosmetic properties, since the solubility of the active compound in most oils likely to be used in pharmaceutical emulsion formulations is very low. Thus, the cream should  
20 preferably be a non-greasy, non-staining and washable product with suitable consistency to avoid leakage from tubes or other containers. Straight or branched chain, mono- or dibasic alkyl esters such as di-isoadipate, isocetyl stearate, propylene glycol diester of coconut  
25 fatty acids, isopropyl myristate, decyl oleate, isopropyl palmitate, butyl stearate, 2-ethylhexyl palmitate or a blend of branched chain esters may be used. These may be used alone or in combination depending on the properties required. Alternatively, high melting point lipids such  
30 as white soft paraffin and/or liquid paraffin or other mineral oils can be used.

Formulations suitable for topical administration to the eye also include eye drops wherein the active ingredients are dissolved or suspended in suitable  
35 carrier, especially an aqueous solvent for the active ingredients. The antiinflammatory active ingredients are

preferably present in such formulations in a concentration of 0.5 to 20%, advantageously 0.5 to 10% and particularly about 1.5% w/w.

For therapeutic purposes, the active compounds of this combination invention are ordinarily combined with one or more adjuvants appropriate to the indicated route of administration. If administered *per os*, the compounds may be admixed with lactose, sucrose, starch powder, cellulose esters of alkanolic acids, cellulose alkyl esters, talc, stearic acid, magnesium stearate, magnesium oxide, sodium and calcium salts of phosphoric and sulfuric acids, gelatin, acacia gum, sodium alginate, polyvinylpyrrolidone, and/or polyvinyl alcohol, and then tableted or encapsulated for convenient administration. Such capsules or tablets may contain a controlled-release formulation as may be provided in a dispersion of active compound in hydroxypropylmethyl cellulose. Formulations for parenteral administration may be in the form of aqueous or non-aqueous isotonic sterile injection solutions or suspensions. These solutions and suspensions may be prepared from sterile powders or granules having one or more of the carriers or diluents mentioned for use in the formulations for oral administration. The compounds may be dissolved in water, polyethylene glycol, propylene glycol, ethanol, corn oil, cottonseed oil, peanut oil, sesame oil, benzyl alcohol, sodium chloride, and/or various buffers. Other adjuvants and modes of administration are well and widely known in the pharmaceutical art.

Although this invention has been described with respect to specific embodiments, the details of these embodiments are not to be construed as limitations.

**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 11-16 are directed to a method of treatment of the human body, the search has been carried out and based on the alleged effects of the compounds.
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
